Series Information:

Criminal activity at school poses an obvious threat to the safety of students and can act as a significant barrier to the education process. In order to study the relationship between victimization at school and the school environment, and to monitor changes in student experiences with victimization, accurate information regarding its incidence must be collected.

The Census Bureau conducts an ongoing survey called the National Crime Victimization Survey (NCVS) for the Bureau of Justice Statistics (BJS). This survey is a major source of statistical information about the nature and extent of crime throughout the United States. Periodically, along with the regular NCVS information, additional information is obtained about specific issues related to crime using a supplemental survey instrument. The school crime supplement is one such survey.

Subject Information

Keyword(s): crime, crime in schools, crime rates, crime reporting, crime statistics, drugs, educational environment, fear of crime, juvenile crime, offenses, property crimes, reactions to crime, robbery, school attendance, school security, school violence, student attitudes, student behavior, vandalism, victimization, victims

Topic Classification(s): Social Institutions and Behavior, Crime and the Criminal Justice System

Abstract

The primary purpose of the School Crime Supplement is to obtain additional information about school-related victimizations so that policymakers, academic researchers, practitioners at the Federal, state and local levels, and special interest groups who are concerned

- Study 34980 -

with crime in schools can make informed decisions concerning policies and programs. The SCS asks questions related to students' experiences with, and perceptions of crime and safety at school, including preventive measures employed by schools, students' participation in after school activities, students' perception of school rules and enforcement of these rules, the presence of weapons, drugs, alcohol, and gangs in school, student bullying, hate-related incidents, and attitudinal questions relating to the fear of victimization at school. These responses are linked to the NCVS survey instrument responses for a more complete understanding of the individual student's circumstances.

The 2013 School Crime Supplement (SCS) was the tenth implementation of an occasional supplement to the annual NCVS to obtain specific information about school-related victimization and disorder on a national level. The SCS was fielded first in 1989, and then again in 1995, 1999, 2001, 2003, 2005, 2007, 2009, 2011, and 2013. The initial fielding in 1989 was conducted by the BJS in conjunction with the National Institute of Justice (NIJ). The 1995 supplement was jointly sponsored by the BJS and the National Center for Education Statistics. The 1999 SCS was sponsored by the National Center for Education Statistics (NCES), which plans to conduct the SCS as a supplement to the NCVS every two years. Since the SCS is a supplement to the NCVS, it is conducted under the authority of title 42, United States Code, section 3732. Only Census employees sworn to preserve confidentiality may see the completed questionnaires.

Summary Data Description

Date(s) of Collection: January, 2013 - June, 2013

Country: United States

Geographic Coverage: United States

Geographic Unit: Region

Unit of Analysis: Individual

Universe:

NCVS interviews are conducted with each household member age 12 years old or older. In 2013 only household members ages 12 to 18 were given an SCS interview, following a completed NCVS interview. Persons ages 12 to 18 who were in primary or secondary education programs leading to a high school diploma (elementary through high school), and who had been enrolled sometime during the six months prior to the interview, were administered the 2013 SCS questionnaire. Persons who had dropped out of school; been expelled or suspended from school; or who were temporarily absent from school for any other reason, such as illness or vacation, were eligible as long as they were attending school at any time during the six months prior to the month of the interview. Students who were home schooled were not included past the screening questions since it was determined that many of the questions in the SCS were not relevant to their situation.

In 1989 and 1995, NCVS sample household members age 12-19 were considered eligible to receive the SCS. However, it was determined that most 19 year olds did not meet the eligibility criteria of being currently enrolled in a secondary school so the upper range was lowered to 18 years old for the 1999 SCS.

School, for SCS purposes, was defined as any institution designed to advance a person toward a high school diploma. This included graded public or private elementary schools, middle schools, high schools, home schools, Church schools, and vocational or trade schools that led to a high school diploma. Not included were persons attending colleges or universities, except in cases where a high school student was taking an upper level course before the high school diploma was obtained; persons seeking their GED; persons attending night school; and persons attending vocational trade, business, correspondence, or other specialized schools that are not associated with academics such as beauty schools and mechanic schools.

Methodology and Processing

Data Collection Methodology

Time Method: Cross-section

Data Collector: United States Department of Commerce. Bureau of the Census

Sampling Procedure:

The SCS was administered at the end of the NCVS interview for each eligible respondent. The 2013 SCS was conducted from January through June 2013.

- Study 34980 -

Each month the U.S. Census Bureau selects respondents for the NCVS using a "rotating panel" design. Households are randomly selected and all age-eligible individuals become part of the panel. The sample of households is divided into groups or rotations. Once in the sample, respondents are interviewed every six months for a total of seven interviews over a three-year period. The first interview is considered the incoming rotation. The second through the seventh interview are in the continuing rotations. The first interview is face-to-face; the rest are by telephone unless the circumstances call for an in-person interview. After the seventh interview the household leaves the panel and a new household is rotated into the sample. The rotation scheme is used to reduce respondent burden that may result if they were to remain permanently in the sample. The SCS was administered at all NCVS households interviewed from January through June 2013.

Mode of Data Collection:

For both the NCVS and the SCS, data collection was done using computer-assisted telephone interviewing and computer-assisted personal interviewing.

Type of Research Instrument: Structured

Weighting:

Because the National Crime Victimization Survey and School Crime Supplement Survey sample represent the U.S. population 12 years and older, population estimates can be generated from the sample cases. That is, the data collected can be used to make inferences about the 12- to 18-year-old student population in 2013. Before such inferences can be made, it is important to adjust the sample to assure that the sample is similar to the entire population of such students. Each person interviewed in the survey represents a probable percentage of all cases if the total population were to be interviewed. Multiplying each case by a factor (i.e., weight) adjusts the unweighted counts to the population size. The final weight adjusts for unequal probabilities of selection. The SCS public use file provides two weights which are used depending whether NCVS or SCS estimates are being generated.

The weights created for the SCS are a combination of household-level and person-level adjustment factors. In the NCVS, adjustments were made to account for both household and person non-interviews. Additional factors were then applied to reduce the variance of the estimate by correcting for the differences between sample distribution of age, race, and sex, and known population distributions of these characteristics. This also reduced the bias due to undercoverage of various portions of the population. The resulting weights were assigned to all interviewed households and persons on the file.

Modifications to the regular NCVS weighting program were necessary for the weighting of the SCS file. Modified weighting procedures were necessary because of the following differences between SCS and NCVS:

- The eligible population for SCS differs from the eligible population for NCVS.
- A person can respond to the NCVS and not the SCS.

A special weighting adjustment was performed on the SCS data. Noninterview adjustment factors were computed to adjust the weighting for SCS noninterviews. The SCS weights on the file are as follows:

- SCS BASE WEIGHT - This weight is the weight before the within-SCS noninterview adjustment factor is applied. This weight can be used to analyze the SCS portion of nonresponse.
- SCS PERSON WEIGHT - This weight is derived using the final NCVS person weight with a within-SCS noninterview adjustment factor applied. This weight can be used for producing estimates from the NCVS variables (excluding crimes) or the SCS variables. Note: Through 2005, there was one SCS weight for producing estimates for the NCVS variables and another SCS weight for producing estimates from the SCS variables. Due to the inclusion of the incoming interview in the NCVS estimates, the same weight now applies to both.

Other weights on the file are:

- NCVS HOUSEHOLD WEIGHT - This weight can be used to produce estimates of the number of households with children 12 to 18 years old.
- INCIDENT WEIGHT - This weight does not have the SCS noninterview adjustment. It is used for NCVS estimates of the number of incidents as opposed to victimizations and the characteristics of those incidents.
- VICTIMIZATION WEIGHT - This weight does not have the SCS noninterview adjustment. It is used for NCVS estimates of the number of victimizations for NCVS crimes. It includes the bounding adjustment that makes the NCVS estimates comparable to past NCVS estimates that use only continuing rotations. Limitation: Because the victimization weight is not adjusted for the school crime supplement nonresponse, the user cannot make an estimate of an NCVS crime from the school crime supplement file that will match the NCVS estimate.

- Study 34980 -

Comparisons of student victimization rates among the eight supplements should be made with caution. For the 1989 and the 1995 SCS, 19-year old household members also were considered eligible for the SCS interview. This upper age range was lowered to 18 for eligibility in the 1999 SCS because it was determined that most 19-year-olds did not meet the other eligibility requirement of being currently enrolled in a secondary school. In addition, due to the redesign of the NCVS in 1992, NCVS item-based cross-year changes in reported victimization rates, or lack thereof, may only be the result of changes in how the questions were asked and not of actual changes in the incidence of victimization. Because NCVS questionnaires were completed before students were given the SCS, it is likely that these changes to the NCVS victimization screening procedures differentially affected responses to the 1989 and 1995 SCS victimization items. Other items, such as fear at school, avoidance of places at school, and reports of gangs at school, followed the victimization items on the SCS survey.

Notes

SURVEY METHODOLOGY

Due to changes in NCVS survey methodology in 2006 that mainly affected rural areas, estimates for 2006 and subsequent years for rural areas are not comparable to previous years. As a result, this variable may not accurately reflect the extent of victimization in urban, suburban and rural areas. Therefore, care should be taken in interpreting the results of this variable. See Criminal Victimization, 2006 Technical Notes for an explanation of the changes to the survey and their impacts on estimates of crime.

Notes

QUESTIONNAIRE DEVELOPMENT

The Bureau of Justice Statistics, the National Center for Education Statistics, and the Census Bureau jointly designed the survey questionnaire. Since many of the questions used in the 1995 survey were incorporated in the 1999 instrument, only minimal testing of the questionnaire was conducted for 1999 and subsequent years.

All of the SCS instruments differ in some respects. Due to the significant changes that occurred to the NCVS data collection procedure and instrument during the 1992 redesign, caution should be used when comparing results from the 1989 SCS to later years for the SCS.

The final questionnaire consisted of eight sections. They included:

- Screen Questions - The first section contained the screen questions which were asked to determine if the respondent was eligible for the SCS.
- Environmental Questions - This section obtained selected information on the type of school the student attended, including whether the school was private or public, the grade levels taught, student transportation to and from school, student involvement in extra-curricular activities, measures taken by the school to ensure student safety, classroom and school rule enforcement, measures of student support, and the availability of drugs and alcohol in school.
- Fighting, Bullying, and Hate Behaviors - The third section contained questions related to students' experiences with physical fights, bullying, and hate-related words and hate-related graffiti at school.
- Avoidance - The fourth section contained avoidance questions which identified the effect of fear of crime on behavior. The avoidance questions were designed to determine if students stayed away from school or particular places at school, or avoided participating in extra-curricular activities at their school for fear of being attacked or harmed.
- Fear - The fifth section asked questions pertaining to how often student feared an attack or being harmed.
- Weapons - The sixth section asked questions pertaining to weapons. The purpose of these questions was to determine if students brought weapons to school for protection.
- Gangs - The seventh section contained questions relating to the presence of organized gangs at school.
- Student Characteristics - The eighth section contained questions on the respondent's attendance, grades, and plans regarding college.

Notes

GENERAL INTERVIEWING SEQUENCE

The general interview sequence for the SCS was to ask all appropriate NCVS questions of one household member and if eligible for the SCS, ask all appropriate SCS questions before proceeding on to the next household member. This is done to avoid any increase in NCVS nonresponse due to the supplemental questions. The NCVS-1, the screen questionnaire, describes criminal incidents using everyday language in order to ascertain whether the respondent has been victimized during the six months prior to interview. The screening section relies on a series of cues and questions to describe various behaviors and characteristics of a criminal event.

- Study 34980 -

Any positive responses are followed by the incident report (NCVS-2), detailing the specific characteristics of each incident. Once the NCVS data collection process is complete, each eligible respondent is administered the SCS.

Notes

PROXY INTERVIEWS

The same proxy respondent rules apply to the SCS that apply to the NCVS. Proxy interviews are interviews conducted in which one household member answers the questions for another in the household. For the SCS, household members ages 12 to 18 were interviewed directly except in limited situations in which proxy interviews were accepted. If the interview was a proxy for the NCVS, a proxy interview was acceptable for the SCS. Proxy interviews were allowed only under the following circumstances:

- If a child was 12 or 13 years old, a self-response interview was attempted. If parents refused to let the interviewer speak to the 12 or 13 year old, a proxy interview could be conducted with the parent.
- If a household member between ages 12 to 18 years old was temporarily absent and not expected to return to the sample household at all during the interview period, a proxy interview was acceptable.
- A proxy interview was accepted if a household member was considered physically or mentally unable to answer the questions. Specifically, the person must have been unable to be interviewed due to health problems or mental incompetence. Further, this condition must have been continuous during the entire interview period and did not include colds or flu, temporary incapacitation, or problems that might have been aggravated because the respondent found the questions upsetting.
- If an interview could not be obtained, and one of the above situations did not exist, a proxy interview was not allowable and the respondent was considered a noninterview. Proxy interviews accounted for 432 of the 5,726 interviews in 2013.

Noninterviews

A person was considered a noninterview for the SCS if:

- the person was an NCVS noninterview,
- the person was an NCVS interview but refused or was unavailable for the SCS interview,
- the person was physically or mentally unable to answer the questions and no proxy was available, or
- an acceptable proxy respondent refused to give a proxy SCS interview.

Interviewers were instructed to complete selected items on the SCS questionnaire to identify each type of noninterview. Of the 9,552 eligible respondents, there were 3,826 noninterview persons, or 40.1 percent of the eligible SCS sample.

Responses to both the NCVS and SCS are confidential by law by the BJS under title 42, United States Code, sections 3735 and 3789g, and by the Census Bureau under title 13, United States Code, section 9. Interviewers are instructed to conduct interviews in privacy unless respondents specifically agree to permit others to be present. Most interviews for the NCVS and SCS were conducted by telephone, and most questions required "yes" or "no" answers, thereby affording respondents a further measure of privacy. By law, identifiable information about respondents may not be disclosed or released to others for any purpose.

Data Appraisal Information

Response Rate:

Of the 9,552 NCVS respondents eligible for the SCS supplement, 5,726 (59.9%) completed the SCS interview. The remaining 40.1% were noninterviews.

Unit response rates indicate how many sampled units completed interviews. Because interviews with students could only be completed in households that responded to the NCVS, the unit completion rate for the SCS reflects both the NCVS household interview completion rate and the student interview completion rate. See Appendix I - Response Rates. (The response rate for households with students between the ages of 12 and 19 (for the 1989 and 1995 SCS) and between the ages of 12 and 18 (for the 1999 SCS) was not calculated, but is assumed to be the same as that of all households. The reported unit response rates are unweighted.)

In 1992, the National Crime Survey (NCS) was redesigned and renamed the National Crime Victimization Survey (NCVS). Because of the redesign, victimization estimates from the 1995 and later SCS cannot be readily compared to the 1989 estimates. One of the many changes made during the redesign was the implementation of a different screening procedure meant to elicit a more complete tally of victimization incidents than did the one used in the 1989 NCS. For instance, the screener used in 1995 and later specifically asked whether

- Study 34980 -

respondents had been raped or otherwise sexually assaulted, whereas the 1989 screener did not. Therefore, cross-year changes between pre- and post-redesign stages in reported victimization rates, or lack thereof, may only be the result of changes in how the questions were asked (For more details about this issue, see Kinderman, Lynch, Cantor (1997)).

For most types of crime, the redesigned methods elicit more reports of victimizations. However, the effect is not uniform across all types of crime and sub-populations. For example, some crime categories, such as assault, are affected more by the NCVS redesign than others, such as robbery. Other effects of the NCVS redesign include improved estimates of certain hard to enumerate crimes such as domestic violence, rape and sexual attack (Rand, Lynch and Cantor, 1997).

Because NCVS questionnaires are completed before students are given the SCS questionnaire, it is likely that changes to NCVS victimization screening procedures completed in 1992 differentially affected responses in 1995 and subsequent SCS victimization items. While the assumption is not possible to test, it is nonetheless reasonable to expect that by providing a more detailed victimization screening instrument in the 1995 and later NCVS, respondents in these years had improved victimization recall than did 1989 SCS respondents.

Estimates of Sampling Error:

The sample of students selected for each SCS is just one of many possible samples that could have been selected. It is possible that estimates from a given SCS student sample may differ from estimates that would have been produced from other student samples. This type of variability is called sampling error, or the standard error, because it arises from using a sample of students rather than all students.

The standard error is a measure of the variability of a parameter estimate. It indicates how much variation there is in the population of possible estimates of a parameter for a given sample size. The probability that a complete census count would differ from the sample estimate by less than 1 standard error is about 68 percent. The chance that the difference would be less than 1.65 standard errors is about 90 percent, and that the difference would be less than 1.96 standard errors, about 95 percent.

Standard errors are typically developed assuming that the sample is drawn purely at random. The sample for the SCS was not a simple random sample, however. The NCVS and SCS rely on a stratified, multi-stage cluster sample design. Standard errors should be calculated by taking this "design effect" into consideration. Failure to take it into account will compromise statistical tests. Calculating standard errors by assuming a simple random sample (which is the default in most statistical software packages) when in fact a cluster sample was used results in standard errors that are smaller than when taking cluster sampling into consideration. Further, estimates are generally computed on weighted rather than raw data, which are sums of the weights of the cases selected. Computing standard errors on these sums as if they were independent observations would produce artificially small results and thus compromise the statistical tests involved.

Calculation of the standard errors requires procedures that are markedly different from the ones used when the data are from a simple random sample. One can use direct variance calculation methods designed for complex survey designs, or compute statistics and standard errors by using generalized variance function (gvf) constant parameters.

For additional discussion of the gvf and calculating standard errors, see Appendix II - Standard Errors.

Other Forms of Data Appraisal:

The NCVS and the SCS utilize several response categories for missing data. Analysts may want to familiarize themselves with these in order to properly interpret the data. A discussion of the missing data categories follows.

During the course of interviewing respondents are generally able to provide specific answers to the questions asked, however, sometimes a respondent is unable to provide a valid response to the question. In certain circumstances the respondent will not know the answer while other questions may elicit a refusal to respond. Refusals to respond are generally associated with sensitive questions like personal income. In order to promote analytically useful data on both NCVS and NCVS supplement public use files (PUFs) the potential for response to a question must be accounted for. Beginning with the 2009 SCS, detail on the reasons for nonresponse was collected. Where data were once coded collectively as residue, using 8's or a combination of 8's and 9's, data categories are now available to indicate specific types of missing data. Users should note that this type of detail is only available on the SCS supplement, not for the main NCVS.

Potential responses to the SCS include: valid values; explicit don't know; blind don't know; blind refusals; residue; out of universe/off path. Furthermore, it is important that data users understand the response categories that they may encounter while using an NCVS or NCVS supplement public use file. For this reason, a more detailed explanation of possible response categories is provided below.

- Valid values - These are the responses presented on the questionnaire for a given question.

- Study 34980 -

- **Explicit don't know** - On some questions a "don't know" response is explicitly presented as a valid response to a survey question. If a question contains an explicit don't know then the question should not accept a blind don't know response. If a question includes an explicit don't know response, the response option will appear on the printed survey form and in the data file as a valid value.
- **Blind don't know** - Most questions accept a blind don't know response. The response is 'blind' because it is not displayed as an available response for a specific question, but is recorded as a separate category of non-response if offered by the respondent. If a question allows a blind don't know response then it should not have an explicit don't know response. If a question accepts a blind don't know response, the response option will not appear on the printed survey form, but "don't know" values will still appear in the data file.
- **Refused** - Any question that is asked on any survey or supplement has a potential to be refused. To account for this, every question accepts a blind refusal response. The response is 'blind' because it is not displayed as an available response for a specific question. Refusal responses are assigned a value of '8', '98', '998', etc depending on the length of the value accepted. For example, a refusal response to a question with Yes/No response options would be '8'. A question that contains 8 or more response options would present an issue since the value 8 already represents a valid categorical response and therefore it cannot be used to indicate a refusal response. In these types of situations the length of the field containing the value is expanded by one position and the refusal response is assigned a value of '98'.
- **Residue** - Residue values indicate that a response is missing for the question that should be answered. Residue values are identified by an '8', '98', '998', etc. based on the length of the field containing the response values. In circumstances where a question contains residue and refused responses, residue will be identified with a value of '8' and a refused response will be identified with a value of '98'. This is consistent with the way residue values are presented for NCVS variables.
- **Out of scope/universe** - Out of scope or out of universe values indicate that a response is not anticipated for a question. This is most likely due to the logical skip patterns that exist in the survey or supplement. Sometimes out of scope or out of universe values are referred to as 'off-path' which indicates a question was legitimately not asked due to the skip pattern. In circumstances where a question contains out of scope and blind don't know responses, out of scope will be identified with a value of '9' and blind don't know responses will be identified with a value of '99'. This is consistent with the way out of scope values are presented for NCVS variables.
- **Item invalid until YYYY Q#** - This type of missing data is represented by -1. Variables with this code were created during the data year, and the code of -1 means that the missing data is due missing data.
- **Item invalid after YYYY Q#** - This type of missing data is represented by -2. Variables with this code were dropped from use during the data year. The code distinguishes it from normal out of universe missing data. Codes -1 and -2 are user specified missing values.

Data Files Description

File-by-File Description

Contents of Files:

The SCS public use file is a six-month person-level file containing data for: 1) all households containing SCS-eligible persons (interviewed and noninterviewed, incoming (unbounded) and continuing rotations), 2) all SCS-eligible persons (interviewed and noninterviewed) within these households, and 3) all incidents reported by the SCS-eligible persons.

The file does not contain information for any households that did not have SCS-eligible persons in them, nor does it contain information for any persons within a household other than those who were SCS-eligible. That is, if a household contained one non SCS-eligible person and one SCS-eligible person, only the SCS-eligible person information was included as a record on the file.

NCVS data are organized in a hierarchical format. There are four unique record types:

- Record Type 001, the address record, contains limited information about the household.
- Record Type 002, contains the entire NCVS household record.
- Record Type 003, contains the entire NCVS person record which was expanded to include the SCS information.
- Record Type 004, contains the entire incident record.

For the SCS, these records were restructured into a single record for each SCS person, containing an expanded incident record to include information on all incidents reported by that respondent in the same record. A maximum number of seven incidents was needed to capture all the incidents reported by a single respondent. That is, no SCS person reported more than seven incidents in 2013. The SCS data file is rectangular where each case on the public use file represents an SCS individual with between zero and seven incidents.

Prior to its release, the file was reviewed by the Census Bureau's Disclosure Review Board (DRB) to ensure that the contents of the file did not violate any disclosure avoidance measures. In addition, data that may have provided geographic information by inference were blanked because of data confidentiality reasons.

Although the school attended was uniquely coded, the DRB mandated that this code be suppressed in the public use file to avoid disclosure of information about any one individual.

File Dimensions:

- No. of Cases: 9,552
- No. of Variables: 4,680
- Record Length: 6,597
- Records per Case: 1
- Overall No. of Records: 9,552

Type of File: ASCII data file

Data Format: Logical record length

Place of File Production: Ann Arbor, MI: Inter-university Consortium for Political and Social Research

Extent of Processing Checks: The data collection was processed according to the standard ICPSR processing procedures. The data were checked for illegal or inconsistent code values which, when found, were recoded to missing data values. No consistency checks were performed.

Notes

- Study 34980 -

The school crime supplement file is a person-level file with NCVS incident-level information appended to each person record. Variables for a maximum of seven incidents have been appended to the person records. The incident variables are named with a prefix of V4 and a suffix of _1 to _7. The codebook describes only the first iteration of the incident variables. Descriptions for iterations two through seven are excluded because they are identical to iteration one.

Notes

While it is not necessary to match the SCS 2013 file to the NCVS 2013 files - virtually all the variables from the NCVS are included with the SCS - it can be done. To match the SCS 2013 file to the NCVS 2013 person record-type file, create an NCVS ID FOR PERSONS (IDPER) by concatenating:

- SAMPLE NUMBER
- SCRAMBLED CONTROL NUMBER
- HOUSEHOLD NUMBER
- PANEL AND ROTATION GROUP
- PERSON LINE NUMBER

The resulting variable is the "key" for matching to the NCVS 2013 person record-type file.

Notes

The available setup files for statistical packages contain RENAME statements to create variable names that are consistent with the Census Bureau's source codes and stay constant for each SCS administration. These correspond to the item numbers shown to the left of the response options on the SCS questionnaire, preceded by "SC." For example, question 1a. "Did you attend school at any time this school year?" is labeled as SC006 in the rename statement. In some instances these names are more than eight characters. For Question 21b, the source codes are duplicative of those on the main NCVS, therefore these items have been renamed with "SCS" appended (e.g. SC107SCS). By default the rename statement in each statistical package setup file is commented out. Remove the comment indicator to make the statement active.

National Crime Victimization Survey: School Crime Supplement, 2013

Variable Description

Summary statistics (minimum, maximum, mean, median, and standard deviation) may not be available for every variable in the codebook. Conversely, a listing of frequencies in table format may not be present for every variable in the codebook either. However, all variables in the dataset are present and display sufficient information about each variable. These decisions are made intentionally and are at the discretion of the archive producing this codebook.

V1003 - YEAR AND QUARTER IDENTIFICATION

Location: 1-3 (width: 3; decimal: 0)

Variable Type: numeric

Text:

Source code: Year/Quarter

Text: This variable identifies the year and the quarter of the interview. The first two digits represents the year, and the last digit represents the quarter.

<i>Value</i>	<i>Label</i>
123	2012 Qtr 3
124	2012 Qtr 4

V1004 - SAMPLE NUMBER

Location: 4-5 (width: 2; decimal: 0)

Variable Type: numeric

Text:

Source code: Sample

Text:

Two-digit code used to identify the sequence and source of selection of sample housing units.

See section - Census Sample Information.

V1005 - SCRAMBLED CONTROL NUMBER

Location: 6-25 (width: 20; decimal: 0)

Variable Type: character

Text:

Source code: Scrambled Control Number

Notes:

Beginning with the quarter 1, 2006 (YEARQ = 2006.1) NCVS data files, Census used the 2000 sample design control number scrambling routine to scramble control numbers for 1990 and 2000 sample design cases. Therefore, data users will not be able to match 1990 sample design cases on NCVS data files released for quarter 1, 2006 and beyond (YEARQ >= 2006.1) to 1990 sample design cases on NCVS data files prior to quarter 1, 2006 (YEARQ <= 2006.1).

Scrambled control was expanded to 20 characters in 2005 Q1. Consequently it was defined as a string variable.

Beginning in July 1986 the previously used PSU, segment number, check digit and serial number are scrambled together by the Census Bureau as one variable to preserve confidentiality.

For 1980 sample-first 10 digits -- last four digits are blank (through quarter 4, 1995). For 1990 sample-all 14 digits are used (beginning quarter 3, 1995). Scrambled control number (part) - See V1007 for last two digits of scrambled control number.

V1006 - HOUSEHOLD NUMBER

Location: 26-26 (width: 1; decimal: 0)

Variable Type: numeric

Text:

Source code: Household Number

Text: This number identifies the sequence of households that occupy a particular address. For example, if a new family moves into a sample unit being interviewed for a second time, the household number will be "2" indicating that this is a different household from that previously interviewed.

<i>Value</i>	<i>Label</i>
1	Original household
2	1st replacement household
3	2nd replacement household
4	3rd replacement household
5	4th replacement household
6	5th replacement household
7	6th replacement household

V1008 - PANEL AND ROTATION GROUP

Location: 27-28 (width: 2; decimal: 0)

Variable Type: numeric

Text:

Source code: Panel/Rotation

- Study 34980 -

Text: The "tens" digit identifies the panel; the "units" digit identifies the rotation group. For example 16 represents panel 1 and rotation group 6. Together, the digits identify clusters which are used in conjunction with the rotation chart.

Source code: VICTIMIZATION WEIGHT

For quarters 1 and 2, 2006, adjustments were made to the final weights that impacted the weighted crime estimates for the NCVS. This adjustment was a one-time event implemented to counteract the effects of including the bounding interview on the NCVS PUF. Traditionally, the bounding interview is excluded from the PUF.

Past research has shown that unbounded interviews produce higher victimization rates than bounded interviews. Therefore a decision was made to adjust downward the estimated number of crimes reported in the new areas to reduce the bias caused by using unbounded interviews. There is also evidence that victimization rates may vary by the number of times the household has been interviewed. To reflect this, the adjustment was performed by time in sample (TIS).

The adjustments made to the final weights were based on collection-year 2003 data due to the unavailability of the collection-year 2005 data and anomalies encountered in the 2004 data. One set of adjustment factors was calculated for personal crimes by TIS and another for property crimes by TIS.

These adjustment factors were applied to the final weight of persons and households. The victimization weight contains these adjusted weights. For any other time period, the victimization weight will be the same as the person weight or household weight for personal and property crimes, respectively.

Appendix I – Response Rates

Year	Household Completion Rate	Student Completion Rate	Overall SCS Response Rate
1989	96.5%	86.5%	83.5%
1995	95.1	77.5	73.7
1999	93.8	77.6	72.8

2011	90.7	63.3	57.4
2013	85.5	59.9	51.2

* In 2005, the person level nonresponse rate for the 12-18 population was 29.6 percent compared to 24.2 percent in 2003 on the NCVS. This negatively affected the student completion rate because SCS eligible respondents that do not complete their NCVS interview are not eligible for the SCS.

The gvf represents the curve fitted to the individual standard errors calculated using the Jackknife Repeated Replication technique. The three constant parameters (a, b, and c) derived from the curve fitting process are provided above for those who prefer to use this alternative method of calculating standard errors:

To calculate the standard errors associated with percentages, the following formula is used:

$$\text{standard error of } p = \sqrt{\frac{bp(1.0-p)}{y} + \frac{cp(\sqrt{p}-p)}{\sqrt{y}}}$$

where p is the percentage of interest expressed as a proportion and y is the size of the population to which the percentage applies. Once the standard error of the proportion is estimated, it needs to be multiplied by 100 to make it applicable to the percentage.

To calculate the adjusted standard errors associated with population counts, the following applies:

$$\text{standard error of } x = \sqrt{ax^2 + bx + cx^{\frac{3}{2}}}$$

where x is the estimated number of students who experienced a given event (e.g., violent victimization).

The U.S. Bureau of the Census has developed a set of programs to calculate NCVS generalized variance formulae, known as SIGMA programs. To facilitate use of these formulae, spreadsheet versions of these SIGMA programs are available on the BJS web site (www.ojp.usdoj.gov/bjs/), which will allow users to enter gvf constants and values in appropriate cells. Spreadsheet macros will then calculate the appropriate variances and standard errors and perform tests for any differences requested.

INTRO 3 - Now I have some questions about things that happen at school. For this survey, "at school" includes the school building, on school property, on a school bus, or going to and from school. Your answers will not be given to anyone.

17a. The following question refers to the availability of drugs and alcohol at your school.

Tell me if you don't know what any of these items are.

FIELD REPRESENTATIVE - For "Don't Know" responses, probe if necessary to determine if respondent means they do not know if the drug is available or if they do not know the drug.

FIELD REPRESENTATIVE - For each item ask,

Is it possible to get _____ at your school?

a. Alcoholic beverages

b. Marijuana

c. Crack

d. Other forms of cocaine

e. Uppers such as ecstasy, crystal meth or other illegal stimulants

f. Downers such as GHB or sleeping pills

g. LSD or acid

h. PCP or angel dust

i. Heroin or smack

j. Prescription drugs illegally obtained without a prescription, such as Oxycontin, Vicodin, or Xanax

k. Other illegal drugs

If "Yes" is marked, ASK - What drugs?
(Exclude tobacco products.)

FIELD REPRESENTATIVE - Refer to Drug Slang Card (SCS-2). Reclassify the "other illegal drug(s)" to one of the categories a-i if possible. If able to reclassify the drug(s) mentioned, mark the "No" box in category k, otherwise, mark the "Yes" box in category k and enter the "other illegal drug(s)" mentioned in the Specify space.
